

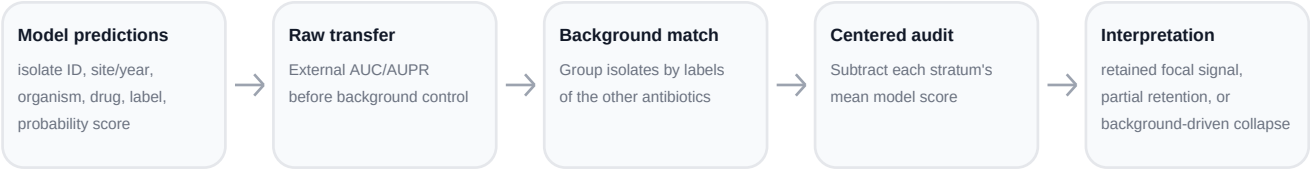

Fig. 1 | Background-matched MALDI-AMR audit

A model-agnostic test of whether focal-drug prediction survives co-resistance background control.

Audit outputs

- **raw AUC** apparent external performance
- **matched AUC** performance in strata with both R and S isolates
- **background-centered AUC** ranking after stratum-level score shifts are removed
- **matched retention** how much of the target comparison remains interpretable
- **cross-resistance network** the label ecology the model could exploit
